

Vector Components

Components = parts

All vectors have 2 components one component runs parallel to the x-axis, one component runs parallel to the y-axis.

We find components using trigonometry

Find the components of the vector below:

$$\frac{\text{opp}}{\text{hyp}} = \sin \theta$$

$$\frac{\text{opp}}{10} = \sin 37$$

$$\text{opp} = 10 \sin 37 = 6.0$$

$$\frac{\text{adj}}{\text{hyp}} = \cos \theta$$

$$\frac{\text{adj}}{10} = \cos 37$$

$$\text{adj} = 10 \cos 37 = 8.0 \text{ m}$$

$$x = 50 \cos 30 = 43$$

7a) $x_{\text{comp}} = 8.66$
 $y_{\text{comp}} = 5 \uparrow$

b) $x_{\text{comp}} = 14.1$
 $y_{\text{comp}} = 14.1 \uparrow$

c) $x_{\text{comp}} = 20$
 $y_{\text{comp}} = 34.6 \downarrow$

d) $x_{\text{comp}} = 4.4$
 $y_{\text{comp}} = 14.3 \downarrow$

e) $x_{\text{comp}} = 17 \leftarrow$
 $y_{\text{comp}} = 0$

f) $x_{\text{comp}} = 7.66$
 $y_{\text{comp}} = 6.4 \downarrow$

Components are used to simplify vector addition.

Vectors that neither parallel, nor perpendicular should be broken into components, this makes parts which are parallel (all X components are parallel to each other, all Y comps are parallel to each other).

Find an X-total, and a Y-total

1) find comps of every vector

2) total X's

3) total y's

4) Draw totals tip to tail

5) Pythag and \tan^{-1}

find resultant of every vector

100 m/s at 30° :
 $x = 100 \cos 30 = 86.6$
 $y = 100 \sin 30 = 50 \uparrow$

80 m/s at 60° :
 $x = 80 \cos 60 = 40$
 $y = 80 \sin 60 = 69 \uparrow$

100 N at 45° :
 $y = 100 \sin 45 = 70.7 \text{ N}$

75 m/s at 35°

43 N from E

$\tan^{-1} \left(\frac{119}{126.6} \right) = \theta$

$16 \cos 20 = y = 15$
 $16 \sin 20 = x = 5.5$

$x_{\text{TOT}} = 151.1$
 $y_{\text{TOT}} = 171.1$

$c^2 = a^2 + b^2$
 $c = 201$

$\tan^{-1} \left(\frac{98}{67} \right) = \theta = 56^\circ$

$$16 \cos 20 = y, \quad 15 \downarrow$$

$\frac{16}{x} = \frac{16 \sin 20}{5.5} \rightarrow$

$$y_{TOT} = 15 \downarrow + 7.9 \downarrow = 22.9 \downarrow$$

$$\tan^{-1} \left(\frac{67}{98} \right) = \theta = 34^\circ$$

18.7 from W

Find an X total

And a y total

Draw those tip to tail, (X total and Y total)
 Resulting vector can then be seen.

find the resultant of

opp = TAN theta
 adj = theta

$$x_{TOT} = 10 + 12 = 22$$

$$y_{TOT} = 17.3 \uparrow + 5 \downarrow = 12.3 \uparrow$$

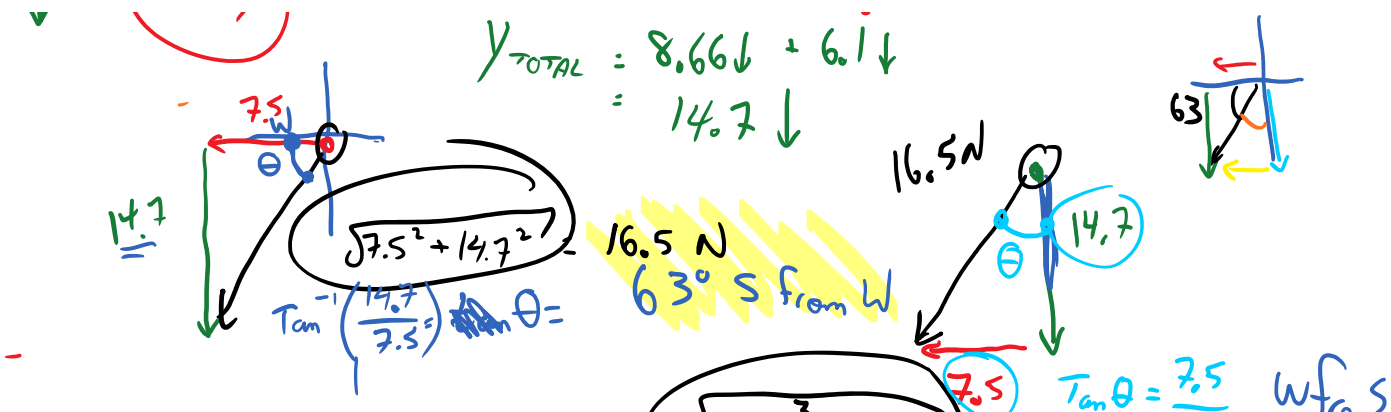

$$\tan^{-1} \left(\frac{12.3}{22} \right) = 29^\circ \text{ from E}$$

- 1) Draw vectors
- 2) Break into x and y components
- 3) Find X total and Y total <= watch for negative directions
- 4) Draw X total and Y total TIP TO TAIL
- 5) Pythagoras' theorem for magnitude
- 6) \tan^{-1} for angle

Find the resultant of 10 N at 30° E from S and 14 N at 26° S from W

$y_{TOT} = 10\downarrow + 7.07\downarrow$
 $= 17\downarrow$
